

Juan Carlos Rodicio

AI ENGINEER / SENIOR SOFTWARE ENGINEER

support@rcuadrado.es / Seville, Spain

github.com/jcarlosrodicio / linkedin.com/in/jcarlosrodicio

Eleven years on Java and Spring Boot backends, microservices and event-driven systems. Now I build **runtime-agnostic harnesses** that turn coding agents into bounded, reviewable engineering workflows: explicit phases, durable resumable state, contracts and iteration budgets, per-role model routing, and **traced runs I can score and evaluate**. Author of two open-source orchestration kits and of Aqorin, published on npm.

01

ORCHESTRATION

Harnesses, adapters and evaluation loops I designed and built

OPEN SOURCE

Node.js 22 and 24
OpenCode

OAK OpenCode Agent Orchestration Kit

github.com/jcarlosrodicio/opencode-agent-orchestration-kit

- Multi-agent harness that turns OpenCode into a structured engineering team: **nine specialised roles** (lead, researcher, designer, specifier, developer, reviewer, evaluator, debugger, evolver) behind a bounded lead router.
- Durable workflows on **schema-versioned JSON snapshots and append-only JSONL history**, with contract hashing, idempotent action IDs and exclusive locking for crash-safe resume.
- Bounded autonomy: explicit contracts, iteration caps, an independent read-only review pass against the original scope, and **model-agnostic execution** with per-role model assignment.

IN PROGRESS

TypeScript
npm [@aqorin/cli](#)
Private repository

Aqorin runtime-agnostic orchestration layer

- Owns **canonical engineering workflows** and maps their execution onto different coding-agent runtimes: OpenCode, jcode, Pi and Codex.
- **Capability-based Runtime Adapter SDK** over hexagonal TypeScript packages and JSON Schema contracts, so a new runtime is an adapter, not a rewrite.
- SQLite-backed durable runs (**runs, status, inspect, logs**), fail-closed consent-gated provisioning, phased delivery with recorded exit evidence and mandatory **Human Experience Checkpoints**. [@aqorin/cli](#) 0.1.0 on npm, macOS arm64 verified.

CROSS-CUTTING

LangFuse
Arize Phoenix

Observability and agent evaluation

- **LangFuse traces every agent I run**. Those traces feed task scores and custom evaluators, so a harness change is judged on measured outcomes, not impressions.
- Self-hosted **Arize Phoenix** deployment, **tally-phoenix-observability**, tracing the receipt-scan LLM calls in Tally. Kept as its own small repository so it builds without the full app context.

IN PROGRESS

TypeScript
PostgreSQL, MCP
Private repository

Grodar growth intelligence platform

- Multi-project, product-agnostic platform built on one explicit pipeline.
Observation → Signal → Opportunity → Action → Experiment → Measurement → Learning

OPEN SOURCE

In progress
Node.js 22+, Pi

- Ingests visibility sources (Search Console, Bing, Google Play, App Store Connect, SERP, GEO and AI search, competitors, reviews, backlinks), keeps the facts in PostgreSQL and derives **deterministic, explainable, prioritised opportunities**.
- Exposed through a web dashboard and **Grodar MCP**, so agents consume the same contract as humans. One contract test suite runs against in-memory, PGlite and real Postgres.

Pi Agent Orchestration Kit

github.com/jcarlosrodicio/pi-agent-orchestration-kit

- **The same philosophy as OAK**, ported to the **Pi runtime**: the same phase discipline, research through review, run over Pi's native subagent system instead of collapsing into one model pass.
- Read-only lead router, optional scope, evaluation, debug and evolution sidecars, per-agent model routing, and **pi-switch**, a TUI for model selection.
- Safety boundary: environment-variable guards against secret propagation, repository checks rejecting symlinks and private markers, and a publication workflow separating the private harness from the public distribution.

02

EXPERIENCE

Eleven years of backend engineering

04/2022 – Present

Lookiero Tech
Remote

Senior Software Engineer

- Backend services in **Java and Spring Boot** on a microservice architecture, with hexagonal architecture and CQRS keeping responsibilities separated.
- REST and GraphQL APIs for internal and external systems, plus asynchronous event-driven flows with RabbitMQ.
- Team-built **AI model, trained and hosted on AWS**, that validates addresses in the delivery flow.
- **MCP server** built for the product team, giving them direct, self-service access to the team's systems and data.
- **Agent skills defined inside the repository** so that whichever coding agent is used follows the same deterministic, repeatable workflow.
- Frontend monorepo with React and Expo. Technical decisions, code review, continuous quality improvement.

Java 25, Spring Boot, React, Expo, microservices, REST, GraphQL, RabbitMQ, AWS, Jenkins, GitHub Actions, Bitbucket, Grafana, Kibana, CQRS, hexagonal architecture, MCP.

10/2021 – 04/2022

Grupo Avalon
Remote

Senior Software Developer

- Microservice-based backend applications with Java 11 and Spring Boot, integrated through REST APIs and messaging systems.
- Unit and integration testing to sustain delivery quality.

Java 11, Spring Boot, microservices, REST, JUnit 5, Kafka, IBM MQ, Jenkins, Git.

12/2020 – 10/2021

Sngular
Seville, Spain

Software Developer

- Microservice-based applications and backend services with Java 11, Spring and Spring Boot.
- Enhancement analysis, technical solution design and integration with external systems over REST and gRPC.

Java 11, Spring, Spring Boot, microservices, MongoDB, REST, gRPC, JUnit 5, Bamboo, Git.

04/2018 – 12/2020

Deloitte
Seville, Spain

Technical Analyst

- Enhancements in enterprise applications, service modernisation and system integration over REST, SOAP and Java technologies.
- Technical task management and coordination of team members.

Java 8, Spring, Spring Boot, microservices, DB2, REST, SOAP, WebSphere, JavaScript, JSP, Git, SCM.

02/2016 – 04/2018

SDOS
Seville, Spain

Programmer

- Enhancements in software applications, backend and frontend, in Java and Angular environments.
- Integration with Oracle and MySQL databases, REST APIs and application servers.

Java 8, Spring, Spring Boot, Oracle, MySQL, REST, WebLogic, Tomcat, JavaScript, Angular, Git.

03

PRODUCTS

Mobile apps designed and built end to end

iOS and Android

Flutter, Supabase
Drift, fastlane

Tally personal finance

- Local-first expense and income tracking: accounts, currencies, categories, goals, receipt images and CSV export.
- Feature-owned Clean, DDD and hexagonal boundaries, GoRouter and Drift persistence, Supabase Auth for session and OAuth, releases automated with fastlane for TestFlight and Google Play.

05/2024 – Present

iOS and Android
Flutter

Cinepedia

- Film information browser integrating external APIs behind a modular architecture.

04

TOOLKIT

ORCHESTRATION

Multi-agent harnesses, MCP servers, agent skills, phase and contract-based workflows, durable run state, per-role model routing, bounded autonomy

AGENT RUNTIMES

OpenCode, Claude Code, Codex, Pi

OBSERVABILITY

LangFuse, Arize Phoenix, task scoring and custom evaluators, Grafana, Kibana

BACKEND

Java 8 / 11 / 17 / 21 / 25, Spring Boot, Spring Framework, REST, GraphQL, gRPC

ARCHITECTURE

Microservices, hexagonal architecture, CQRS, DDD, event-driven systems

DATA, MESSAGING

PostgreSQL, Oracle, MySQL, DB2, MongoDB, SQLite, Drizzle, RabbitMQ, Kafka, IBM MQ

CLOUD, DELIVERY

AWS, Docker, Jenkins, GitHub Actions, Bamboo, Bitbucket, Git, fastlane

TESTING

JUnit 5, Mockito, Vitest, Testcontainers, integration and contract testing

LANGUAGES, UI

Java, TypeScript, JavaScript, Dart, Node.js, React, Expo, Flutter, Angular

05

EDUCATION

09/2010 – 09/2015

Seville

Software Engineering Degree

Higher School of Computer Engineering

09/2008 – 06/2010

Seville

Higher Vocational Training, Computer Systems Administration

Nuevas Profesiones

Languages

Spanish native / English intermediate
